In a time of unstable energy costs and growing environmental crisis, policies and investments that encourage sprawling, unplanned growth run the same risks of overvaluation - and sudden collapse - that have afflicted national housing markets. Designs and developments that recognize the human scale and maximize infrastructure already in place look like a safer bet. During these times of crisis and transformation, the way forward looks hazy but decidedly different from the recent past.

The illiterate of the 21st century will not be those who cannot read and write, but those who cannot learn, unlearn, and relearn.

Alvin Toffler

Amusingly, even as job growth was slowing across the board, the central Arkansas region managed to grow jobs at a slightly faster pace than the Northwest Arkansas metropolitan region. After years of extremely fast annual growth, Northwest Arkansas jobs grew just 1.2 percent from 2006 to 2007. Central Arkansas job growth was slightly higher, at 1.5 percent, during the same period.

The chart on the following page (bottom left) shows that a large share of central Arkansas job growth - and economic growth - is occurring in Faulkner County. From 2002 to 2007, Faulkner County contributed over one-quarter of all job growth in the metro area, nearly twice as much as the other outlying counties combined. The region's traditional employment center, Pulaski County, contributed 61 percent of the new jobs, still the largest share but with the slowest annual job growth rate among the six counties.

Unemployment in central Arkansas remained below state and U.S. averages, at 4.0 percent in August, 2008, compared with 4.6 percent for the state of Arkansas and 6.1 percent for the national average. Most economic forecasts predict that unemployment will continue rising, however, well into 2009.

3 Arkansas Department of Workforce Services, nonfarm payroll jobs series, not seasonally adjusted.
The central Arkansas region has had a lengthy period of prosperous growth since 2000, reversing a period of decidedly anemic growth during the years 1996-1999. The recent prosperity, coupled with continuing economic diversity, may cushion the region in face of national economic restructuring. Nonetheless, the drastic recent drop-off in central Arkansas housing markets (see pp. 8-10), points to inevitable linkages with national trends. Local income and employment trends will not be immune to shock waves currently jostling the U.S. and global economies.

The central Arkansas region has had a lengthy run of prosperity and above-average growth since 2000, reversing a period of decidedly anemic growth during the years 1996-1999. The recent prosperity, coupled with continuing economic diversity, may cushion the region in face of national economic restructuring. Nonetheless, the drastic recent drop-off in central Arkansas housing markets (see pp. 8-10), points to inevitable linkages with national trends. Local Strength 1n Hard Times

Petroleum Perils 2008

Last year, Metroplan’s Economic Review and Outlook addressed global oil worries in an article titled “The End of Cheap Oil.” We pointed to a future of chaotic price changes, relentless demand increases in China, India, and other developing countries, and flat global oil production since 2005.

As of this writing, oil prices are tumbling to levels not seen since early 2007. Yet staggering oil price hikes since about 2004 aggravated the debt crisis and contributed to a developing global recession. The chart below compares world oil production and prices since 2001. As you can see, oil prices whipsawed up and down—mostly up—while production barely gained. Throughout the years 2005, 2006, and 2007, as prices soared to levels never before seen, global oil production remained flat-lined around 84.5 million barrels per day.

Finally, in early 2008, responding to prices and perhaps political pressures, production nudged up a bit, hitting a new global peak of 87.1 million daily barrels in July of 2008. With the global economy sputtering, demand weakened and prices fell. Yet from January, 2001 to July, 2008, even after prices had dropped from their peak, the price of a barrel of oil had climbed 350 percent, to yield just 11 percent more oil.

Source: U.S. Energy Information Administration

These trends explain why even the conservative and market-friendly journal The Economist recently announced: “Peak oil, if oil means the traditional sort that comes cheaply out of holes in the ground, will probably arrive soon. There is oil aplenty of other sorts (tar sands, liquefied coal, and so on) … But it will get expensive to produce, putting a floor on the price that is way above today’s.”

While it is unlikely that oil prices will rise during a global economic downturn, price volatility will remain an issue over the longer term. Businesses and governments that prepare for renewed energy price hikes during the current respite will hold a competitive advantage when economic recovery puts the pressure back on.

The chart uses index values for price and supply in which January 2001=1.0. Thus, the oil price spike in early 2008 shows that prices were 4.5 times greater than in January 2001. Metroplan developed this index from U.S. Energy Information Administration monthly data on price and supply at www.eia.doe.gov, accessed 10/21/08. July 2008 figures are the latest available.

Local income and employment trends will not be immune to shock waves currently jostling the U.S. and global economies.

Local Strength, continued from page 1

Income growth has also favored central Arkansas in recent years. Per Capita income in central Arkansas was about $37,785 in 2007, ranking 86th among 363 U.S. metro areas. Local income grew 17 percent from 2001 to 2007, after adjusting for inflation. Thus, local income grew nearly twice as fast as the U.S. average (9.9 percent) during these years. These figures may be distorted by the sale of local firm Alltel. This sale has yielded a share of the income spike, at least during the large executive bonuses which accounted for 86th among 363 U.S. metro areas.

Global Petroleum Supply & U.S. Prices
What is striking about the map below? At first glance, this image of Conway’s changing city limits from 2000 to 2008 merely confirms modest boundary growth. Look more closely, then glance at the chart at right. See something surprising? From 2000 to 2008, Conway grew 12 percent in land area, while population grew by over 33 percent—almost three times as fast. U.S. cities have been losing density—sprawling, some say—for more than fifty years. And Conway was doing the same. In recent years, though, Conway has begun moving in a different direction.

Growing & Changing in Conway

The chart below compares density trends in Conway with Pulaski County cities, from 1960 to 2008. As you can see, the cities in Pulaski County have, since about 1990, slowed their population dispersion. This fits with a national trend of more concentrated growth. But Conway has actually reversed a trend, and is gaining density. How, and why, is this happening?

One contributing factor may be a growing stock of multi-family housing. But Conway’s multi-family housing growth was faster in proportion during the 1980’s, when density was still declining, than during the 1990’s and 2000’s, with density rising. Something else is at work.

The real reason is probably Conway’s land development policies. The City of Conway—working with the private, not-for-profit Conway Corporation—requires new developments to tie into Conway Corporation utilities for sewer, water, electricity and cable television. The city is conservative about annexing new land, and only does so at the request of landowners. The slow pace of annexation keeps costs down, reducing the amount of infrastructure that would be needed with less careful policies. Housing impact fees, first imposed in 2003, help defray the cost of providing city services to new housing.

Conway’s policies contribute to its enviably low cost structure. Housing costs remain 20 percent below the national average, and slightly below the regional average. While per capita utility costs in central Arkansas run above the national average, Conway utility costs are below the U.S. average. Within Arkansas, two other fast-growing cities have also begun regaining density—Springdale and Fayetteville. Changing demographics account for some of the change, but both have imposed impact fees, and Fayetteville’s land use policies may be a factor.

It is perhaps not a coincidence that Hewlett-Packard chose to site a new 1,200-worker facility in Conway. Land use and infrastructure planning are often derided as antithetical to economic growth. Experience in Conway demonstrates instead that thoughtful planning can cut costs and build the foundation for economic dynamism and prosperity.

Little Rock has continued dispersing, while three faster-growing cities have reversed the trend.

Conway's Zest for Innovation

Land use planning is only one of many areas in which Conway stands out as a creative community. The examples below further demonstrate the city's willingness to get ahead of the curve with new ideas.

Dave Ward Drive. The recent widening of Dave Ward Drive was completed in 2005. The rebuilt road was designed with a median-divided boulevard cross-section to improve safety and increase capacity. Working with the Arkansas Highway and Transportation Department and Metroplan, the City of Conway developed a three-party access management effort that helps safeguard the road's future traffic-moving potential. The Dave Ward access management agreement that helps safeguard the road's future traffic-moving potential. The Dave Ward access management effort has won national recognition.

Roundabouts. In the vicinity of Hendrix Village, Harkrider Street has been redesigned to incorporate two roundabouts in a cooperative effort between Hendrix College, the City of Conway, and the Arkansas Highway Department. These intersections will move traffic smoothly, with fewer conflicts and greater safety than traditional stoplights. Roundabouts have been developed elsewhere in the City of Conway also.

Transportation Department and Metroplan, the City of Conway developed a three-party access management agreement that helps safeguard the road's future traffic-moving potential. The Dave Ward access management effort has won national recognition.

Hendrix Village. Hendrix College is today developing a walkable community adjacent to its campus just north of downtown Conway. Working cooperatively with the city, the college aims to provide workplaces, restaurants, shops and housing together in a classic New Urbanist community.

Our Carbon Footprint

An Outsized Carbon Footprint in Central Arkansas

In May of 2008, the Brookings Institution released a report comparing the carbon emissions of America's 100 largest metropolitan areas. The results for the Little Rock-North Little Rock-Conway region were not flattering. The central Arkansas region ranked 85th worst overall, with a carbon footprint of 3.009 metric tons per capita, nearly one-third larger than the U.S. metropolitan average of 2.235.

The study included separate analyses of residential and transportation energy use. Central Arkansas did not rank too badly in residential energy consumption, at 43rd overall. The area's relatively moderate climate -- free of the exceptionally frigid winters or long, sensationally torrid summers found in some parts of the country -- probably helped. Just as important, a higher-than-average portion of local electricity comes from carbon-free nuclear power.

In transportation central Arkansas ranked as the 96th worst overall. Only three other metropolitan areas in the country had higher carbon emissions from transportation. Likely reasons included above-average commuting distances, a high share of commuting by single-occupancy vehicle, minimal use of mass transit, and a larger-than-average share of light trucks in the passenger vehicle fleet.

Housing Construction Trends

Housing Construction Still Seeking Bottom

Central Arkansas single-family housing construction accelerated its decline during the first half of 2008, yielding the slowest growth in new single-family units since 1997. All major cities in the region except Maumelle had fewer single-family starts in the first half of 2008 than the same period in 2007. Multi-family construction did better, hardly booming but providing one bright spot in a beleaguered housing construction industry. Apartment and townhouse/condo construction levels in Little Rock, North Little Rock, and Conway were all higher in the first six months of 2008 than the first half of 2007.

The chart below shows Metroplan’s index for single-family construction, based on the years 2004 and 2005 as average, or 1.0. The U.S. construction index had slid to an anemic 0.36 by the third quarter of 2008. The performance of the Little Rock-North Little Rock-Conway MSA was marginally better, at 0.39, meaning construction had dropped to 39 percent of its level during the boom years 2004 and 2005. The change in housing markets has passed the threshold of normal cyclical changes, reflecting a national economy in crisis.

Construction Value Trends

The value of regional construction edged up slightly in 2007, helped by an uptick in nonresidential construction. The value of new housing construction continued to slide. The drop in new residential construction value was caused by weakness in single-family housing, muted somewhat by the strongest performance in multi-family housing since 2004. Nonresidential construction was especially strong in the City of Little Rock, which accounted for over $311 million — about 60 percent of total nonresidential construction in the region. The majority of this construction in the capital city was for public and private projects of an institutional nature — churches and other religious institutions, hospitals, and schools. North Little Rock ranked second highest, with $90 million in nonresidential projects, while Conway had about $53 million in nonresidential construction.

Broken down within the region, overall construction value gained a bit in Pulaski County, while total construction investments ran slower in the outlying counties during 2007 than the previous year. The slowdown was especially pronounced in Lonoke County, where a total construction value of $41 million was down 48 percent from the year before and less than half its performance in 2004.

Economic Outlook 2008

Thanks to rising energy exports and local economic diversity, central Arkansas has not been hit too hard — so far — by the global economic storm. U.S. unemployment may peak early next year around 7.5 percent, while economic growth could resume by the middle of 2009 — if oil prices remain under $100/bbl.1 Since recessions are often economic turning-points, we may soon witness structural economic changes emerging from today’s hard times. (3) the northeastern U.S. and maritime Canada, with good connections to all three via railroads, highways, and (to all but the first) water transportation. The largest windmill blades exactly match the 200-ft. length of river barges utilizing Little Rock’s power industry. Central Arkansas benefits from its location about midway between the three primary wind-power regions of the U.S. — (1) the American west and plains region, (2) the Gulf of Mexico, and (3) the northeastern U.S. and maritime Canada, with good connections to all three via railroads, highways, and (to all but the first) water transportation. The largest windmill blades exactly match the 200-ft. length of river barges utilizing Little Rock’s

Construction Value 2001-2007

While local construction showed little gain over the past year, central Arkansas nonetheless outpaced the national average for overall construction. The chart above compares US and central Arkansas trends in construction value using an index based on average construction value 1995-2000. Construction in central Arkansas gained value slightly, while the U.S. average dropped from 2006 to 2007.

Locally, the national housing downturn has clearly impacted the average value of new single-family homes. The chart at above right on the facing page shows the median value at the permit stage for new single-family housing units in the four-county region. As you can see, median value barely dropped 2005-2006, but fell more steeply from 2006 to 2007. The housing devaluation trend is hitting new construction, not just existing units. This unprecedented trend would look even starker if values were adjusted for inflation.

Economic Outlook 2008

The year 2008 has seen major local success with attracting new firms, particularly in the exciting area of manufacturing parts for the nascent wind power industry. Central Arkansas benefits from its location about midway between the three primary wind-power regions of the U.S. — (1) the American west and plains region, (2) the Gulf of Mexico, and (3) the northeastern U.S. and maritime Canada, with good connections to all three via railroads, highways, and (to all but the first) water transportation. OUTLOOK, continued on page 12
Local Strength in Hard Times

Severe national economic conditions are finally taking a toll on the central Arkansas economy, but local conditions remain better than the national average. The chart below depicts Metroplan’s index for local, state and U.S. employment trends from 2000 through the third quarter of 2008. As you can see, during 2008 all three indices were weakening. The only positive note is that local job growth has, so far, slowed less markedly than US and state averages.

In a time of unstable energy costs and growing environmental crisis, policies and investments that encourage sprawling, unplanned growth run the same risks of overvaluation – and sudden collapse – that have afflicted national housing markets. Designs and developments that recognize the human scale and maximize infrastructure already in place look like a safer bet. During these times of crisis and transformation, the way forward looks hazy but decidedly different from the recent past.

The illiterate of the 21st century will not be those who cannot read and write, but those who cannot learn, unlearn, and relearn. – Alvin Toffler

Other local trends remain partly obscured behind lame housing markets and global financial-sector turmoil. Retail over-building in Pulaski County has yielded vacancies in centers old and new, including western Little Rock, North Little Rock’s once-vibrant McCain Mall, and elsewhere.

Multi-family construction has defied trends with near-normal construction levels, concentrating mostly in Little Rock, North Little Rock, Conway and Bryant. Pulaski County’s apartment occupancy grew nearly a full percentage point, from 92.3 percent in 2007 to 93.2 percent in 2008 - an impressive gain in economic hard times. After years of retrenchment, local manufacturing may continue a comeback thanks to advantageous location, more favorable international exchange rates, and higher transoceanic transport costs.

Unemployment in central Arkansas remained below state and U.S. averages, at 4.0 percent in August, 2008, compared with 4.6 percent for the state of Arkansas and 6.1 for the national average. Most economic forecasts predict that unemployment will continue rising, however, well into 2009.
